

Medication Dispenser

What is it?

The medication dispenser is a simple to use tablet dispenser which enables individuals to take the correct medication at the right time.

Who is it for?

The dispenser is suitable for anyone who has a large number or complex combination of tablets to take on a daily basis, especially people who need to take medication within a specific timeframe. It is beneficial to older people or individuals with mental health issues who are often prescribed medication in high volumes.

How does it work?

Two versions of the medication dispenser are available, the PivoTell MK13/11 and the PivoTell Advance.

Both portable medication dispensers can be set up with prescribed tablets, with scheduled time for each dose. This allows users to take their medication at the correct time each day, while keeping other pills safe. A flashing light reminds the user if the medication has not been taken within the timeframe and an alert is also raised via a Lifeline unit to a monitoring centre or carer pager.

The medication can be accessed by turning the dispenser over to release the tablets into the hand or suitable container. When the dispenser 'beeps' (at approx. 135°) the alarm will be cancelled and the dispenser can be returned to the upright position.

Why Argenti?

We focus on using the latest digital and mobile technology to enable people to feel safe, secure and independent, giving them the freedom to live the life they choose. Our service is already benefiting over 18,000 customers across the South East.

Features
