

Internal Door Sensors

What is it?

The internal door sensors combine several devices together. These work in unison to ensure that those with various levels of cognitive impairment remain safe and secure in their homes.

How does it work?

The door sensor has two magnetically connected parts. One part is attached to the door frame and the other is attached to the door. An alert is raised when the two parts are no longer connected. The device can be deactivated for up to an hour to allow access through the door without triggering an alert.

Features & Benefits

- ✓ *Transmitter and 2 door sensors as standard*
- ✓ *Can be linked to a dedicated pager lifeline unit*
- ✓ *An alert is triggered when the door is opened*
- ✓ *Helps to detect wandering for those who are at risk of harm*
- ✓ *Pager alerts via vibration and tone for versatility*
- ✓ *Transmission range is around 100 metres*

Why Argenti?

We focus on using the latest digital and mobile technology to enable people to feel safe, secure and independent, giving them the freedom to live the life they choose. Our service is already benefiting over 18,000 customers across the South East.
